GENERALIZED \((\alpha, \beta)\)-RATIONAL CONTRACTIONS
AND FIXED POINT THEOREMS IN ORDERED
\(S_b\)-METRIC SPACES WITH APPLICATIONS

Abstract. In this paper, we define generalized \((\alpha, \beta)\)-rational contraction. Based on this we have to prove some fixed point theorems. Applications related to integral equations and Homotopy theory are presented. Also we gave an example which supported our main results.

Key words: \(S_b\)-metric, generalized \((\alpha, \beta)\)-rational contraction, \(S_b\)-completeness, Homotopy theory, partial ordering and regular.

AMS Mathematics Subject Classification: 47H10, 54H25.

1. Introduction

In 1922 S. Banach [3] formulated the contraction known is Banach contraction principle. Some results related with generalization of metric space can be found in ([1]-[12]).

In 1989, Bakhtin formulated the \(b\)-metric spaces [2], later several researchers work on this space and obtained so many results on this spaces can be found in ([5, 6, 7]).

In generalized contractions one is \((\alpha, \beta)\)-weak contraction. Using this contraction, researchers proved results (for detail see [13, 14, 15, 16, 17]). Currently the study of \((\alpha, \beta)\)-contractions gain the attractions of many researches. In this regards many fixed point results and their applications are studied (see [18, 19, 20] and the reference cited therein).

Mustafa et. al. defined the notion of \(G\)-metric space [4]. Sedghi et. al. gave the concept of an \(S\)-metric space [11]. Aghajani et.al. presented a new type of metric is called \(G_b\)-metric [1]. Recently Sedghi et al. [10] defined \(S_b\)-metric space by using the \(S\)-metric space [11].

The aim of present article is to prove applications to integral equations and Homotopy theory via generalized \((\alpha, \beta)\)-rational contraction, we can also gave related fixed point results and example.

First we recall some basic results.
2. Preliminaries

Definition 1 ([10]). Let $X$ be a non-empty set and $b \geq 1$ be given real number. Suppose that a mapping $S_b : X^3 \to [0, \infty)$ be a function satisfying the following properties:

$(S_b1)$ $0 < S_b(x, y, z)$ for all $x, y, z \in X$ with $x \neq y \neq z \neq x$,

$(S_b2)$ $S_b(x, y, z) = 0 \iff x = y = z$,

$(S_b3)$ $S_b(x, y, z) \leq b(S_b(x, x, a) + S_b(y, y, a) + S_b(z, z, a))$ for all $x, y, z \in X$ and $a \in X$.

Then the function $S_b$ is called a $S_b$-metric on $X$ and the pair $(X, S_b)$ is called a $S_b$-metric space.

Remark 1 ([10]). It should be noted that, the class of $S_b$-metric spaces is effectively larger than that of $S$-metric spaces. Indeed each $S$-metric space is a $S_b$-metric space with $b = 1$.

Following example shows that a $S_b$-metric on $X$ need not be a $S$-metric on $X$.

Example 1 ([10]). Let $(X, S)$ be $S$-metric space and $S_*(x, y, z) = S(x, y, z)^p$, where $p > 1$ is a real number. Note that $S_*$ is a $S_b$-metric with $b = 2^{2(p-1)}$. Also, $(X, S_*)$ is not necessarily a $S$-metric space.

Definition 2 ([10]). Let $(X, S_b)$ be a $S_b$-metric space. Then, for $x \in X$, $r > 0$ we defined the open ball $B_{S_b}(x, r)$ and closed ball $B_{S_b}[x, r]$ with center $x$ and radius $r$ as follows respectively:

$$B_{S_b}(x, r) = \{ y \in X : S_b(y, y, x) < r \} \quad \text{and} \quad B_{S_b}[x, r] = \{ y \in X : S_b(y, y, x) \leq r \}.$$  

Lemma 1 ([10]). In a $S_b$-metric space, we have

$$S_b(u, u, w) \leq 2bS_b(u, u, v) + b^2S_b(v, v, w).$$

Lemma 2 ([10]). In a $S_b$-metric space, we have

$$S_b(u, u, v) \leq bS_b(v, v, u) \quad \text{and} \quad S_b(v, v, u) \leq bS_b(u, u, v).$$

Definition 3 ([10]). If $(X, S_b)$ be a $S_b$-metric space. A sequence $\{x_n\}$ in $X$ is said to be:

(a) $S_b$-Cauchy sequence if, for each $\epsilon > 0$, there exists $n_0 \in \mathbb{N}$ such that $S_b(x_n, x_m, x_m) < \epsilon$ for each $m, n \geq n_0$.

(b) $S_b$-convergent to a point $x \in X$ if, for each $\epsilon > 0$, there exists a positive integer $n_0$ such that $S_b(x_n, x_m, x) < \epsilon$ or $S_b(x_n, x, x_n) < \epsilon$ for all $n \geq n_0$ and we denote by $\lim_{n \to \infty} x_n = x$. 
Definition 4 ([10]). A $S_b$-metric space $(X, S_b)$ is called complete if every $S_b$-Cauchy sequence is $S_b$-convergent in $X$.

Lemma 3 ([10]). If $(X, S_b)$ be a $S_b$-metric space with $b \geq 1$ and suppose that $\{x_n\}$ is a $S_b$-convergent to $x$, then we have

(i) $\frac{1}{2b} S_b(y, y, x) \leq \liminf_{n \to \infty} S_b(y, y, x_n) \leq \limsup_{n \to \infty} S_b(y, y, x_n) \leq 2bS_b(y, y, x)$

and

(ii) $\frac{1}{b^2} S_b(x, x, y) \leq \liminf_{n \to \infty} S_b(x_n, x_n, y) \leq \limsup_{n \to \infty} S_b(x_n, x_n, y) \leq b^2 S_b(x, x, y)$

for all $y \in X$.

In particular, if $x = y$, then we have $\lim_{n \to \infty} S_b(x_n, x_n, y) = 0$.

In the next section we gave our main results.

3. Main results

Definition 5. Let $(X, S_b)$ be $S_b$-metric space and let the mapping $E : X \to X$. We say that the mapping $E$ satisfy generalized $(\alpha, \beta)$-rational contraction if there exists continuous maps $\alpha, \beta : [0, \infty) \to [0, \infty)$ such that

(5.1) $\frac{1}{3b} \min \{S_b(x, x, Ex), S_b(y, y, Ey)\} \leq S_b(x, x, y) \Rightarrow \alpha(4b^2 S_b(Ex, Ex, Ey)) \leq \alpha(N_{E}^3(x, y)) - \beta(N_{E}^4(x, y))$,

for all $x, y \in X$, $x$ is comparable to $y$, $i = 3$ or $4$ and

$N_{E}^3(x, y) = \max \left\{ \frac{S_b(x, x, y)}{1+S_b(x, x, y)+S_b(Ex, Ex, Ey)}, \frac{S_b(x, x, y)}{1+S_b(x, x, y)+S_b(Ex, Ex, Ey)} \right\}$,

$N_{E}^4(x, y) = \max \left\{ \frac{S_b(x, x, y)}{1+S_b(x, x, y)+S_b(Ex, Ex, Ey)} \right\}$,

(5.2) $\alpha(t)$ and $\beta(t)$ vanish at $t = 0$

(5.3) $\beta(t) > 0$ for $t > 0$

Definition 6. Let $(X, S_b, \preceq)$ be a partially ordered complete $S_b$-metric space which is said to be regular if every two elements of $X$ are comparable, i.e., if $x, y \in X$ implies either $x \preceq y$ or $y \preceq x$.

Definition 7. Suppose that $(X, \preceq)$ is a partially ordered set and $E$ is a mapping of $X$ into itself. We say that $E$ is non-decreasing if for every $x, y \in X$, $x \preceq y$ implies that $Ex \preceq Ey$.

Theorem 1. Let $(X, S_b, \preceq)$ be an partially ordered complete $S_b$-metric space, $E : X \to X$ satisfies generalized $(\alpha, \beta)$-contraction with $i = 3$ and assume that the non decreasing function $E$ is continuous or $X$ is regular. If there exists $x_0 \in X$ with $x_0 \preceq Ex_0$. Then $E$ has unique fixed point in $X$. 

**Proof.** Let \( x_0 \in X \). Since \( E \) is self-map, there exists a sequence \( \{x_n\} \) in \( X \) such that

\[
x_{n+1} = E x_n, \quad n = 0, 1, 2, 3, \ldots.
\]

**Case (i):** If \( x_n = E x_n = x_{n+1} \), then clearly proof is over.

**Case (ii):** Assume \( x_n \neq E x_n, \forall n \). Since \( x_0 \leq E x_0 = x_1 \) and by definition of \( E \), we have

\[
x_0 \leq E x_0 \leq E^2 x_0 \leq E^3 x_0 \leq \cdots \leq E^n x_0 \leq E^{n+1} x_0 \leq \cdots
\]

Since \( \frac{1}{4b^3} \min \{S_b(x_0, x_0, E x_0), S_b(x_1, x_1, E x_1)\} \leq S_b(x_0, x_0, x_1) \).

Now

\[
\alpha \left( 4b^5 S_b \left( E x_0, E x_0, E^2 x_0 \right) \right) = \alpha \left( 4b^5 S_b \left( E x_0, E x_0, E x_1 \right) \right) \\
\leq \alpha \left( N_f^3 \left( x_0, x_1 \right) \right) - \beta \left( N_f^3 \left( x_0, x_1 \right) \right),
\]

where

\[
N_f^3 \left( x_0, x_1 \right) = \max \left\{ S_b \left( x_0, x_0, x_1 \right), \frac{S_b(x_0,x_0,E_0)S_b(x_1,x_1,E_1)}{1+S_b(x_0,x_0,E_1)+S_b(E_0,E_0,E_1)} \right\} \\
= \max \left\{ S_b \left( x_0, x_0, E x_0 \right), \frac{S_b(x_0,x_0,E_0)S_b(E_0,E_0,E^2 x_0)}{1+S_b(x_0,x_0,E_0)+S_b(E_0,E_0,E^2 x_0)} \right\} \\
= S_b \left( x_0, x_0, E x_0 \right)
\]

Thus

\[
\alpha \left( 4b^5 S_b \left( E x_0, E x_0, E^2 x_0 \right) \right) \leq \alpha \left( S_b \left( x_0, x_0, E x_0 \right) \right) - \beta \left( S_b \left( x_0, x_0, E x_0 \right) \right).
\]

Also since \( \frac{1}{4b^3} \min \{S_b(x_1, x_1, E x_1), S_b(x_2, x_2, E x_2)\} \leq S_b(x_1, x_1, x_2) \).

So that we have

\[
\alpha \left( 4b^5 S_b \left( E^2 x_0, E^2 x_0, E^3 x_0 \right) \right) \leq \alpha \left( S_b \left( E x_0, E x_0, E^2 x_0 \right) \right) \\
- \beta \left( S_b \left( E x_0, E x_0, E^2 x_0 \right) \right).
\]

Continuing this way we can conclude that

\[
\alpha \left( 4b^5 S_b \left( E^{n+1} x_0, E^{n+1} x_0, E^{n+2} x_0 \right) \right) \leq \alpha \left( S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \right) \\
- \beta \left( S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \right).
\]

Thus \( \{ S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \} \) is non-increasing and must converges to a real number \( \eta \geq 0 \) (say). Also

\[
\alpha \left( 4b^5 S_b \left( E^{n+1} x_0, E^{n+1} x_0, E^{n+2} x_0 \right) \right) \leq \alpha \left( S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \right) \\
- \beta \left( S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \right).
Letting $n \to \infty$, we have

$$\alpha(4b^5 \eta) \leq \alpha(\eta) - \beta(\eta).$$

It is clear that $\eta = 0$. That is

$$\lim_{n \to \infty} S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) = 0.$$ 

Now we prove $\{E^n x_0\}$ is Cauchy sequence in $(X, S_b)$. On contrary we suppose that $\{E^n x_0\}$ is not Cauchy. Then there exist $\epsilon > 0$ and monotonically increasing sequence of natural numbers $\{m_k\}$ and $\{n_k\}$ such that $n_k > m_k$.

(1) $$S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k} x_0 \right) \geq \epsilon$$

and

(2) $$S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k - 1} x_0 \right) < \epsilon.$$

First we claim that

(3) $$\frac{1}{4b^3} \min \left\{ S_b \left( x_{m_k}, x_{m_k}, E x_{m_k} \right), S_b \left( x_{n_k-1}, x_{n_k-1}, E x_{n_k-1} \right) \right\} \leq S_b \left( x_{m_k}, x_{m_k}, x_{n_k-1} \right).$$

On contrary suppose

$$\frac{1}{4b^3} \min \left\{ S_b \left( x_{m_k}, x_{m_k}, E x_{m_k} \right), S_b \left( x_{n_k-1}, x_{n_k-1}, E x_{n_k-1} \right) \right\} > S_b \left( x_{m_k}, x_{m_k}, x_{n_k-1} \right).$$

Now consider

$$\epsilon \leq S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{m_k} x_0 \right)$$

$$\leq 2bS_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k - 1} x_0 \right) + b^2 S_b \left( E^{n_k - 1} x_0, E^{n_k - 1} x_0, E^{n_k} x_0 \right)$$

$$< \frac{1}{2b^2} \min \left\{ S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{m_k + 1} x_0 \right), S_b \left( x_{n_k-1}, x_{n_k-1}, x_{n_k} \right) \right\}$$

$$+ b^2 S_b \left( E^{n_k - 1} x_0, E^{n_k - 1} x_0, E^{n_k} x_0 \right).$$

Letting $k \to \infty$, it follows $\epsilon \leq 0$. It is a contradiction. Hence our claim (3) is holds. From (1) and (2), we have

$$\epsilon \leq S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{m_k} x_0 \right)$$

$$\leq 2bS_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{m_k + 1} x_0 \right) + b^2 S_b \left( E^{m_k + 1} x_0, E^{m_k + 1} x_0, E^{n_k} x_0 \right).$$
Letting $k \to \infty$, we have $\frac{\epsilon}{b^3} \leq S_b \left( E^{m+1} x_0, E^{m+1} x_0, E^n x_0 \right)$. Then

\[(4) \quad \alpha \left( 4b^3 \epsilon \right) \leq \lim_{k \to \infty} \alpha \left( 4b^5 S_b \left( E^{m+1} x_0, E^{m+1} x_0, E^m x_0 \right) \right) \]
\[= \lim_{k \to \infty} \alpha \left( 4b^5 S_b \left( E x_{m_k}, E x_{m_k}, E x_{n_k-1} \right) \right) \]
\[\leq \lim_{k \to \infty} \alpha \left( N^3 f \left( x_{m_k}, x_{n_k-1} \right) \right) - \lim_{k \to \infty} \beta \left( N^3 f \left( x_{m_k}, x_{n_k-1} \right) \right), \]

where

\[\lim_{k \to \infty} N^3 f \left( x_{m_k}, x_{n_k-1} \right) = \lim \max \left\{ \frac{S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right)}{S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{m_k+1} x_0 \right) \cdot S_b \left( E^{n_k-1} x_0, E^{n_k-1} x_0, E^{n_k+1} x_0 \right)} \right\}. \]

But

\[\lim_{k \to \infty} \frac{S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k} x_0 \right) \cdot S_b \left( E^{n_k-1} x_0, E^{n_k-1} x_0, E^{n_k+1} x_0 \right)}{1 + S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + S_b \left( E^{m_k+1} x_0, E^{m_k+1} x_0, E^{n_k+1} x_0 \right)} \]
\[= \lim_{k \to \infty} \frac{2b S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + b^2 S_b \left( E^{n_k-1} x_0, E^{n_k-1} x_0, E^{m_k} x_0 \right)}{1 + S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + S_b \left( E^{m_k+1} x_0, E^{m_k+1} x_0, E^{n_k+1} x_0 \right)} \]
\[\leq 4b^3 \epsilon. \]

and

\[\lim_{k \to \infty} \frac{S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k+1} x_0 \right) \cdot S_b \left( E^{n_k-1} x_0, E^{n_k-1} x_0, E^{n_k} x_0 \right)}{1 + S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + S_b \left( E^{m_k+1} x_0, E^{m_k+1} x_0, E^{n_k+1} x_0 \right)} \]
\[= \lim_{k \to \infty} \frac{2b S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + b^2 S_b \left( E^{n_k-1} x_0, E^{n_k-1} x_0, E^{m_k} x_0 \right)}{1 + S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) + S_b \left( E^{m_k+1} x_0, E^{m_k+1} x_0, E^{n_k+1} x_0 \right)} \]
\[\leq 4b^3 \epsilon. \]

Now from (4), we have

\[\alpha \left( 4b^3 \epsilon \right) \leq \alpha \left( 4 b^3 \epsilon \right) - \lim_{k \to \infty} \beta \left( N_E^3 \left( x_{m_k}, x_{n_k-1} \right) \right) < \alpha \left( 4b^3 \epsilon \right).\]

Is a contradiction.
Hence \( \{E_n x_0\} \) is Cauchy sequence in \((X, S_b)\). By completeness of \((X, S_b)\), it follows the sequence \( \{E_n x_0\} \to \vartheta \in (X, S_b) \). That is
\[
\lim_{k \to \infty} E^k x_0 = \vartheta = \lim_{k \to \infty} E^{n+1} x_0.
\]

First we claim that for each \( n \geq 1 \), at least one of the following assertion is holds.

\[
\frac{1}{4b^3} S_b (x_{n+1}, x_{n+1}, x_n) \leq S_b (\vartheta, \vartheta, x_n) \quad \text{or} \quad \frac{1}{4b^3} S_b (x_n, x_n, x_{n-1}) \leq S_b (\vartheta, \vartheta, x_{n-1}).
\]

On contrary suppose that
\[
\frac{1}{4b^3} S_b (x_{n+1}, x_{n+1}, x_n) > S_b (\vartheta, \vartheta, x_n) \quad \text{and} \quad \frac{1}{4b^3} S_b (x_n, x_n, x_{n-1}) > S_b (\vartheta, \vartheta, x_{n-1}).
\]

Now consider
\[
S_b (x_{n-1}, x_{n-1}, x_n) \leq 2b S_b (x_{n-1}, x_{n-1}, \vartheta) + b^2 S_b (\vartheta, \vartheta, x_n)
\]
\[
< 2b^2 S_b (\vartheta, \vartheta, x_{n-1}) + b^2 \frac{1}{4b^3} S_b (x_{n+1}, x_{n+1}, x_n)
\]
\[
< 2b^2 \frac{1}{4b^3} S_b (x_n, x_n, x_{n-1}) + \frac{1}{4b} S_b (x_{n+1}, x_{n+1}, x_n)
\]
\[
= \frac{1}{2b} S_b (x_{n-1}, x_{n-1}, x_n) + \frac{1}{4b} S_b (x_n, x_n, x_{n+1})
\]
\[
\leq \frac{1}{2} S_b (x_{n-1}, x_{n-1}, x_n) + \frac{1}{4b^3} S_b (x_{n-1}, x_{n-1}, x_n)
\]
\[
= \frac{2b^3 + 1}{4b^3} S_b (x_{n-1}, x_{n-1}, x_n)
\]
\[
\leq \frac{3}{4} S_b (x_{n-1}, x_{n-1}, x_n).
\]

It is a contradiction. Hence our claim is holds. Since \( Ex_n \to \vartheta \) and \((X, S_b)\) is regular, it follows \( x_n \) is comparable to \( \vartheta \). Suppose \( E \vartheta \neq \vartheta \). From (5.1) and by the definition of \( \alpha \), Lemma (3), we have

\[
\alpha \left( 2b^4 S_b (E \vartheta, E \vartheta, \vartheta) \right) \leq \lim \inf_{n \to \infty} \alpha \left( 4b^5 S_b (E \vartheta, E \vartheta, E^{n+1} x_0) \right)
\]
\[
\leq \lim \inf_{n \to \infty} \alpha \left( N^3_f (\vartheta, x_n) \right)
\]
\[
- \lim \inf_{n \to \infty} \beta \left( N^3_f (\vartheta, x_n) \right)
\]
Here

\[
\lim_{n \to \infty} N^3_j(\vartheta, x_n) = \lim_{n \to \infty} \max \left\{ \frac{S_b(\vartheta, \vartheta, E\vartheta)}{1 + S_b(\vartheta, \vartheta, x_n) S_b(x_n, x_n, E\vartheta)} \right\}
\]

Hence from (5), we have

\[
\alpha \left( 2b^2 S_b(E\vartheta, E\vartheta, \vartheta) \right) \leq \alpha \left( S_b(\vartheta, \vartheta, E\vartheta) \right) - \beta \left( S_b(\vartheta, \vartheta, E\vartheta) \right)
\]

Clearly \( \vartheta \) is fixed point of \( E \). Assume \( \vartheta^* \) is also fixed point of \( E \). Since

\[
\frac{1}{4b^2} \min \{ S_b(\vartheta, \vartheta, E\vartheta), S_b(\vartheta^*, \vartheta^*, E\vartheta^*) \} \leq S_b(\vartheta, \vartheta, \vartheta^*)
\]

Consider

\[
\alpha \left( 4b^5 S_b(\vartheta, \vartheta, \vartheta^*) \right) \leq \alpha \left( N^4_E(\vartheta, \vartheta^*) \right) - \beta \left( N^4_E(\vartheta, \vartheta^*) \right)
\]

\[
= \alpha \left( S_b(\vartheta, \vartheta, \vartheta^*) \right) - \beta \left( S_b(\vartheta, \vartheta, \vartheta^*) \right)
\]

\[
< \alpha \left( S_b(\vartheta, \vartheta, \vartheta^*) \right).
\]

Example 2. Let us define \( S_b : X \times X \times X \to \mathbb{R}^+ \) by \( S_b(u, v, w) = (|v + w - 2u| + |v - w|)^2 \) where \( X = [0, 1] \) and \( \leq \) by \( u \leq w \iff u \leq w \). So clearly \( (X, S_b, \leq) \) is complete ordered \( S_b \)-metric space with \( b = 4 \). Define \( E : X \to X \) by \( E(u) = \frac{u}{16\sqrt{2}} \), also \( \alpha, \beta : \mathbb{R}^+ \to \mathbb{R}^+ \) by \( \alpha(t) = t \) and \( \beta(t) = \frac{(2b^2 - 1)t}{2b^2} \).

\[
\alpha \left( 4b^5 S_b(Eu, Eu, Ev) \right) = 4b^5(|Eu + Ev - 2Eu| + |Eu - Ev|)^2
\]

\[
= 4b^5 \left( 2 \left| \frac{u}{16\sqrt{2}} - \frac{v}{16\sqrt{2}} \right| \right)^2
\]

\[
= \frac{1}{2b^2} S_b(u, u, v)
\]

\[
\leq \alpha \left( N^3_j(u, v) \right) - \beta \left( N^3_j(u, v) \right).
\]

Hence from Theorem 1, \( 0 \) is unique fixed point of \( E \).

**Theorem 2.** Let \( (X, S_b, \leq) \) be an partially ordered complete \( S_b \) metric space and let \( E : X \to X \) be satisfies generalized \( (\alpha, \beta) \)-contraction with \( i = 4 \) and assume that \( X \) is regular or the non decreasing function \( E \) is continuous. If there exists \( x_0 \in X \) with \( x_0 \leq Ex_0 \). Then \( E \) has unique fixed point in \( X \).
Proof. If we replace $N^i_E (x, y)$ in place of $N^3_E (x, y)$, the rest of proof follows from Theorem 1.

**Theorem 3.** Let $(X, S_b, \preceq)$ be an partially ordered complete $S_b$ metric space and let $E : X \to X$ be satisfies (3.1) $rac{1}{4b^5} \min \{S_b(x, x, Ex), S_b(y, y, Ey)\}$ \leq S_b(x, x, y)$ implies that

$$4b^5 S_b(Ex, Ex, Ey) \leq N^i_E(x, y) - \beta \left( N^i_E(x, y) \right),$$

where $\beta : [0, \infty) \to [0, \infty)$ continuous with $\beta(t) > 0$ for $t > 0$ and $i = 3$ and $X$ is regular or the non decreasing function $E$ is continuous. If there exists $x_0 \in X$ with $x_0 \preceq Ex_0$. Then $E$ has unique fixed point in $X$.

Proof. Let $x_0 \in X$. Since $E$ is self-map, there exists a sequence $\{x_n\}$ in $X$ such that

$$x_{n+1} = E x_n, n = 0, 1, 2, 3, \ldots .$$

Case (i): If $x_n = Ex_n = x_{n+1}$, then clearly proof is over.

Case (ii): Assume $x_n \neq Ex_n, \forall n$. Since $x_0 \preceq Ex_0 = x_1$ and by definition of $E$, we have

$$x_0 \preceq Ex_0 \preceq E^2 x_0 \preceq E^3 x_0 \preceq \cdots \preceq E^n x_0 \preceq E^{n+1} x_0 \leq \cdots$$

Since $\frac{1}{4b^5} \min \{S_b(x_0, x_0, Ex_0), S_b(x_1, x_1, Ex_1)\} \leq S_b(x_0, x_0, x_1)$. Now

$$4b^5 S_b(Ex_0, Ex_0, E^2 x_0) = 4b^5 S_b(Ex_0, Ex_0, Ex_1) \leq N^3_f(x_0, x_1) - \beta \left( N^3_f(x_0, x_1) \right),$$

where

$$N^3_f(x_0, x_1) = \max \left\{ \begin{array}{l} \frac{S_b(x_0, x_0, x_1)}{1 + S_b(x_0, x_0, x_1) + S_b(Ex, Ex, Ex)}, \\
\frac{S_b(x_0, x_0, Ex_0)S_b(x_1, x_1, Ex_1)}{1 + S_b(x_0, x_0, Ex_0) + S_b(Ex, Ex, Ex_0)}, \end{array} \right\}$$

$$= \max \left\{ \begin{array}{l} \frac{S_b(x_0, x_0, Ex_0)S_b(Ex, Ex, E^2 x_0)}{1 + S_b(x_0, x_0, Ex_0) + S_b(Ex, Ex, E^2 x_0)}, \\
\frac{S_b(x_0, x_0, E^2 x_0)S_b(Ex, Ex, Ex_0)}{1 + S_b(x_0, x_0, E^2 x_0) + S_b(Ex, Ex, Ex_0)}, \end{array} \right\}$$

$$= S_b(x_0, x_0, Ex_0)$$

Thus

$$4b^5 S_b(Ex_0, Ex_0, E^2 x_0) \leq S_b(x_0, x_0, Ex_0) - \beta \left( S_b(x_0, x_0, Ex_0) \right).$$

Also since $\frac{1}{4b^5} \min \{S_b(x_1, x_1, Ex_1), S_b(x_2, x_2, Ex_2)\} \leq S_b(x_1, x_1, x_2)$.
So that we have
\[ 4b^5 S_b \left( E^2 x_0, E^2 x_0, E^3 x_0 \right) \leq S_b \left( E x_0, E x_0, E^2 x_0 \right) - \beta \left( S_b \left( E x_0, E x_0, E^2 x_0 \right) \right). \]

Continuing this way we can conclude that
\[ 4b^5 S_b \left( E^{n+1} x_0, E^{n+1} x_0, E^{n+2} x_0 \right) \leq S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) - \beta \left( S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \right). \]

Thus \( \{ S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \} \) is non-increasing and must converges to a real number \( \eta \geq 0 \) (say). Also
\[ 4b^5 S_b \left( E^{n+1} x_0, E^{n+1} x_0, E^{n+2} x_0 \right) \leq S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) \]

Letting \( n \to \infty \), we have
\[ 4b^5 \eta \leq \eta - \beta(\eta). \]

It is clear that \( \eta = 0 \). that is
\[ \lim_{n \to \infty} S_b \left( E^n x_0, E^n x_0, E^{n+1} x_0 \right) = 0. \]

Now we prove \( \{ E^n x_0 \} \) is Cauchy sequence in \( (X, S_b) \). On contrary suppose that \( \{ E^n x_0 \} \) is not Cauchy. Then there exist \( \epsilon > 0 \) and monotonically increasing sequence of natural numbers \( \{ m_k \} \) and \( \{ n_k \} \) such that \( n_k > m_k \).

\[ S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k} x_0 \right) \geq \epsilon \]

and
\[ S_b \left( E^{m_k} x_0, E^{m_k} x_0, E^{n_k-1} x_0 \right) < \epsilon. \]

First we claim that
\[ \frac{1}{4b^3} \min \{ S_b \left( x_{m_k}, x_{m_k}, E x_{m_k} \right), S_b \left( x_{n_k-1}, x_{n_k-1}, E x_{n_k-1} \right) \} \]
\[ \leq S_b \left( x_{m_k}, x_{m_k}, x_{n_k-1} \right). \]

On contrary suppose that
\[ \frac{1}{4b^3} \min \{ S_b \left( x_{m_k}, x_{m_k}, E x_{m_k} \right), S_b \left( x_{n_k-1}, x_{n_k-1}, E x_{n_k-1} \right) \} \]
\[ > S_b \left( x_{m_k}, x_{m_k}, x_{n_k-1} \right). \]
Now consider

$$
\epsilon \leq S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk}x_0 \right)
\leq 2bS_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk-1}x_0 \right) + b^2 S_b \left( E^{mk-1}x_0, E^{mk-1}x_0, E^{mk}x_0 \right)
\leq \frac{1}{2b^2} \min \left\{ S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk+1}x_0 \right), S_b \left( x_{n_k-1}, x_{n_k-1}, x_{n_k} \right) \right\}
+ b^2 S_b \left( E^{mk-1}x_0, E^{mk-1}x_0, E^{mk}x_0 \right).
$$

Letting \( k \to \infty \), it follows that \( \epsilon \leq 0 \). It is a contradiction. Hence our claim (8) is holds. From (6) and (7), we have

$$
\epsilon \leq S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk}x_0 \right)
\leq 2bS_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk+1}x_0 \right) + b^2 S_b \left( E^{mk+1}x_0, E^{mk+1}x_0, E^{mk}x_0 \right).
$$

Letting \( k \to \infty \), we have \( \frac{\epsilon}{b^2} \leq S_b \left( E^{mk+1}x_0, E^{mk+1}x_0, E^{mk}x_0 \right) \). Then

$$
4b^3 \epsilon \leq \lim_{k \to \infty} 4b^5 S_b \left( E^{mk+1}x_0, E^{mk+1}x_0, E^{mk}x_0 \right)
= \lim_{k \to \infty} 4b^5 S_b \left( E x_{mk}, E x_{mk}, E x_{n_k-1} \right)
\leq \lim_{k \to \infty} N_f^3 (x_{mk}, x_{n_k-1}) - \lim_{k \to \infty} \beta \left( N_f^3 (x_{mk}, x_{n_k-1}) \right),
$$

where

$$
\lim_{k \to \infty} N_f^3 (x_{mk}, x_{n_k-1}) = \lim_{k \to \infty} \max \left\{ \frac{S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk-1}x_0 \right), S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk+1}x_0 \right)}{1 + S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk-1}x_0 \right) + S_b \left( E^{mk+1}x_0, E^{mk+1}x_0, E^{mk}x_0 \right)} \right\}.
$$

But

$$
\lim_{k \to \infty} \frac{S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk}x_0 \right) S_b \left( E^{mk-1}x_0, E^{mk-1}x_0, E^{mk+1}x_0 \right)}{1 + S_b \left( E^{mk}x_0, E^{mk}x_0, E^{mk-1}x_0 \right) + S_b \left( E^{mk+1}x_0, E^{mk+1}x_0, E^{mk}x_0 \right)}
\leq 4b^3 \epsilon.
$$
and
\[
\lim_{k \to \infty} \frac{S_b\left(E^{m_k}x_0, E^{m_k}x_0, E^{m_k+1}x_0\right) S_b\left(E^{n_k-1}x_0, E^{n_k}x_0, E^{n_k}x_0\right)}{1 + S_b\left(E^{m_k}x_0, E^{m_k}x_0, E^{n_k-1}x_0\right) + S_b\left(E^{m_k+1}x_0, E^{n_k+1}x_0, E^{n_k}x_0\right)} \leq 4b^3 \epsilon.
\]

Now from (9), we have
\[
4b^3 \epsilon \leq 4b^3 \epsilon - \lim_{k \to \infty} \beta\left(N_E^4 (x_{m_k}, x_{n_k-1})\right) < 4b^3 \epsilon.
\]

Is a contradiction. Hence \(\{E^n x_0\}\) is Cauchy sequence in \((X, S_b)\). By completeness of \((X, S_b)\), it follows that the sequence \(\{E^n x_0\} \to \vartheta \in (X, S_b)\). That is
\[
\lim_{k \to \infty} E^n x_0 = \vartheta = \lim_{k \to \infty} E^{n+1} x_0.
\]

First we claim that for each \(n \geq 1\), at least one of the following assertion is holds.
\[
\frac{1}{4b^3} S_b\left(x_{n+1}, x_{n+1}, x_n\right) \leq S_b\left(\vartheta, \vartheta, x_n\right) \quad \text{or} \quad \frac{1}{4b^3} S_b\left(x_n, x_n, x_{n-1}\right) \leq S_b\left(\vartheta, \vartheta, x_{n-1}\right).
\]

On contrary suppose that
\[
\frac{1}{4b^3} S_b\left(x_{n+1}, x_{n+1}, x_n\right) > S_b\left(\vartheta, \vartheta, x_n\right) \quad \text{and} \quad \frac{1}{4b^3} S_b\left(x_n, x_n, x_{n-1}\right) > S_b\left(\vartheta, \vartheta, x_{n-1}\right).
\]

Now consider
\[
S_b\left(x_{n-1}, x_{n-1}, x_n\right) \leq 2b S_b\left(x_{n-1}, x_{n-1}, \vartheta\right) + b^2 S_b\left(\vartheta, \vartheta, x_n\right)
\leq \frac{1}{2} S_b\left(x_{n-1}, x_{n-1}, x_n\right) + \frac{1}{4b^3} S_b\left(x_{n-1}, x_{n-1}, x_n\right)
= \frac{2b^3 + 1}{4b^3} S_b\left(x_{n-1}, x_{n-1}, x_n\right) \leq \frac{3}{4} S_b\left(x_{n-1}, x_{n-1}, x_n\right).
\]

It is a contradiction. Hence our claim is holds. Since \(E x_n \to \vartheta\) and \((X, S_b)\) is regular, it follows \(x_n\) is comparable to \(\vartheta\). Suppose \(E \vartheta \neq \vartheta\). From (3) and Lemma (3), we have
\[
(10) \quad 2b^3 S_b\left(E \vartheta, E \vartheta, \vartheta\right) \leq \lim_{n \to \infty} \inf \left(4b^5 S_b\left(E \vartheta, E \vartheta, E^{n+1} x_0\right)\right)
\leq \lim_{n \to \infty} \inf \left(N^3_f (\vartheta, x_n)\right) - \lim_{n \to \infty} \inf \beta\left(N^3_f (\vartheta, x_n)\right)
\]
Here
\[
\lim_{n \to \infty} N^3_f (\vartheta, x_n) = \lim_{n \to \infty} \max \left\{ \frac{S_b (\vartheta, \vartheta, E \vartheta)}{1 + S_b (\vartheta, \vartheta, x_n)} \right\} \leq S_b (\vartheta, \vartheta, E \vartheta).
\]
Hence from (10), we have
\[
2b^2 S_b (E \vartheta, E \vartheta, \vartheta) \leq S_b (\vartheta, \vartheta, E \vartheta) - \beta (S_b (\vartheta, \vartheta, E \vartheta)) \leq S_b (\vartheta, \vartheta, E \vartheta).
\]
Clearly \( \vartheta \) is fixed point of \( E \). Assume \( \vartheta^* \) is also fixed point of \( E \not\supsetneq \vartheta^* \). Since
\[
\frac{1}{4b^5} \min \left\{ S_b (\vartheta, \vartheta, E \vartheta), S_b (\vartheta^*, \vartheta^*, E \vartheta^*) \right\} \leq S_b (\vartheta, \vartheta, \vartheta^*).
\]
Consider
\[
4b^5 S_b (\vartheta, \vartheta, \vartheta^*) \leq N^4_E (\vartheta, \vartheta^*) - \beta \left( N^4_E (\vartheta, \vartheta^*) \right) = S_b (\vartheta, \vartheta, \vartheta^*) - \beta (S_b (\vartheta, \vartheta, \vartheta^*)) < S_b (\vartheta, \vartheta, \vartheta^*).
\]
Clearly \( \vartheta \) is unique fixed point of \( E \) in \((X, S_b)\).

\textbf{Theorem 4.} Let \((X, S_b, \preceq)\) be an partially ordered complete \( S_b \) metric space and let \( E : X \to X \) be satisfies generalized \((\alpha, \beta)\)-contraction with \( i = 4 \) and assume that \( X \) is regular or the non decreasing function \( E \) is continuous. If there exists \( x_0 \in X \) with \( x_0 \preceq Ex_0 \). Then \( E \) has unique fixed point in \( X \).

\textbf{Proof.} If we replace \( N^4_E (x, y) \) in place of \( N^3_f (x, y) \), the rest of proof follows from Theorem 3.

\textbf{Theorem 5.} Let \((X, S_b, \preceq)\) be an partially ordered complete \( S_b \) metric space and let \( E : X \to X \) be satisfies \((5.1)\) \( \frac{1}{4b^5} \min \left\{ S_b (x, x, Ex), S_b (y, y, Ey) \right\} \leq S_b (x, x, y) \) implies that
\[
S_b (Ex, Ex, Ey) \leq \lambda N^i_E (x, y),
\]
where \( \lambda \in \left[ 0, \frac{1}{4b^5} \right] \) and \( i = 3, 4 \) and the non decreasing function \( E \) is continuous or \( X \) is regular. If there exists \( x_0 \in X \) with \( x_0 \preceq Ex_0 \). Then \( E \) has unique fixed point in \( X \).

4. Application to integral equations

In this section, we study the existence of a unique solution to an initial value problem as an application to Theorem 3.
Theorem 6. Consider the I. V. P.

\begin{equation}
    u'(x) = P(x, u(x)), \quad x \in I = [0, 1], \quad u(0) = u_0
\end{equation}

where \( P : I \times \left[ \frac{u_0}{4}, \infty \right) \rightarrow \left[ \frac{u_0}{4}, \infty \right) \) and \( u_0 \in \mathbb{R} \). Then (11) has unique solution.

Proof. The integral equation of I. V. P. (11) is

\[ u(x) = u_0 + 5b^4 \int_0^x P(t, u(t))dt. \]

Let \( X = C(I, \left[ \frac{u_0}{4}, \infty \right)) \) and \( S_b(u,v,w) = (|v + w - 2v| + |v - w|)^2 \) for \( u, v, w \in X \). Define \( \beta : [0, \infty) \rightarrow [0, \infty) \) by \( \beta(x) = \frac{(25b^2 - 4)x}{25b^3} \). Define \( E : X \rightarrow X \) by

\begin{equation}
    E(u)(x) = \frac{u_0}{5b^4} + \int_0^x P(t, u(t))dt.
\end{equation}

Now

\[
4b^5 S_b(\text{Eu}(x), \text{Eu}(x), \text{Ev}(x)) = 4b^5 \left( |\text{Eu}(x) + \text{Ev}(x) - 2\text{Eu}(x)| + |\text{Eu}(x) - \text{Ev}(x)| \right)^2 \\
= 16b^5 |\text{Eu}(x) - \text{Ev}(x)|^2 \\
= \frac{16b^5}{25b^3} \left( u_0 + 5b^4 \int_0^x P(t, u(t))dt - v_0 - 5b^4 \int_0^x P(x, v(x))dx \right)^2 \\
= \frac{16}{25b^3} |u(x) - v(x)|^2 = \frac{4}{25b^3} S(u, u, v) \\
\leq N^3_f(u,v) - \beta \left( N^3_f(u,v) \right)
\]

It follows from Theorem 3, \( E \) has a unique fixed point in \( X \).

5. Application to homotopy

In this section, we study the existence of a unique solution to homotopy theory.

Theorem 7. Let \((X, S_b)\) be complete \( S_b \)-metric space, \( U \) be an open subset of \( X \) and \( \overline{U} \) be closed subset of \( X \) such that \( U \subseteq \overline{U} \). Suppose \( H_b : \overline{U} \times [0, 1] \rightarrow X \) be an operator with following conditions are satisfying, (7.1)
\( u \neq H_b(u, \kappa) \) for each \( u \in \partial U \) and \( \kappa \in [0, 1] \) (Here \( \partial U = \) boundary of \( U \) in \( X \)), \( 7.2 \) \( \frac{1}{4b^3} \min \{ S_b(u, u, H_b(u, \kappa)), S_b(v, v, H_b(v, \kappa)) \} \leq S_b(u, u, v) \) implies that

\[ 4b^5 S_b(H_b(u, \kappa), H_b(u, \kappa), H_b(v, \kappa)) \leq S_b(u, u, v) - \beta(S_b(u, u, v)) \]

for all \( u, v \in U \) and \( \kappa \in [0, 1] \), where \( \beta \) defined in Theorem(3), \( 7.3 \) \( \exists M_b \geq 0 \exists S_b(H_b(u, \kappa), H_b(u, \kappa), H_b(u, \zeta)) \leq M_b |\kappa - \zeta| \) for every \( u \in U \) and \( \kappa, \zeta \in [0, 1] \). Then \( H_b(\cdot, 0) \) has a fixed point \( \iff \) \( H_b(\cdot, 1) \) has a fixed point.

**Proof.** Let the set

\[ B = \{ \kappa \in [0, 1] : u = H_b(u, \kappa) \text{ for some } u \in U \}. \]

Since \( H_b(\cdot, 0) \) has a fixed point in \( U \), so \( 0 \in B \).

Now we show that \( B \) is both closed and open in \([0, 1]\) and hence by the connectedness \( B = [0, 1] \). Let \( \{ \kappa_n \}_{n=1}^\infty \subseteq B \) with \( \kappa_n \to \kappa \in [0, 1] \) as \( n \to \infty \). We must show \( \kappa \in B \). Since \( \kappa_n \in B \) for \( n = 1, 2, 3, \ldots \), there exists \( u_n \in U \) with \( u_n = H_b(u_n, \kappa_n) \).

Consider

\[ S_b(u_n, u_n, u_{n+1}) = S_b(H_b(u_n, \kappa_n), H_b(u_n, \kappa_n), H_b(u_{n+1}, \kappa_{n+1})) \]

\[ \leq 2bS_b(H_b(u_n, \kappa_n), H_b(u_n, \kappa_n), H_b(u_{n+1}, \kappa_n)) \]

\[ + b^2 S_b(H_b(u_{n+1}, \kappa_n), H_b(u_{n+1}, \kappa_n), H_b(u_{n+1}, \kappa_{n+1})) \]

\[ \leq 2bS_b(H_b(u_n, \kappa_n), H_b(u_n, \kappa_n), H_b(u_{n+1}, \kappa_n)) \]

\[ + b^2 M |\kappa_n - \kappa_{n+1}|. \]

Letting \( n \to \infty \), we get

\[ \lim_{n \to \infty} S_b(u_n, u_n, u_{n+1}) \]

\[ \leq \lim_{n \to \infty} 2bS_b(H_b(u_n, \kappa_n), H_b(u_n, \kappa_n), H_b(u_{n+1}, \kappa_n)) + 0. \]

Since

\[ \frac{1}{4b^3} \min \{ S_b(u_n, u_n, H_b(u_n, \kappa)), S_b(u_{n+1}, u_{n+1}, H_b(u_{n+1}, \kappa)) \} \]

\[ \leq S_b(u_n, u_n, u_{n+1}). \]

Therefore, from 7, we have

\[ \lim_{n \to \infty} 2b^4 S_b(u_n, u_n, u_{n+1}) \leq \lim_{n \to \infty} 4b^5 S_b(H_b(u_n, \kappa_n), H_b(u_{n+1}, \kappa_n)) \]

\[ \leq \lim_{n \to \infty} [S_b(u_n, u_n, u_{n+1}) - \beta(S_b(u_n, u_n, u_{n+1}))]. \]

It follows that

\[ (13) \quad \lim_{n \to \infty} S_b(u_n, u_n, u_{n+1}) = 0. \]
Now we prove \( \{ u_n \} \) is a \( S_b \)-Cauchy sequence in \( (X, S_b) \). On contrary suppose \( \{ u_n \} \) is not a \( S_b \)-Cauchy. There exists an \( \epsilon > 0 \) and monotone increasing sequence of natural numbers \( \{ m_k \} \) and \( \{ n_k \} \) such that \( n_k > m_k \),

\[
S_b(u_{m_k}, u_{m_k}, u_{n_k}) \geq \epsilon \quad \text{(14)}
\]

and

\[
S_b(u_{m_k}, u_{m_k}, u_{n_k-1}) < \epsilon. \quad \text{(15)}
\]

Therefore from (14) and (15), we have

\[
\epsilon \leq S_b(u_{m_k}, u_{m_k}, u_{n_k}) \leq 2bS_b(u_{m_k}, u_{m_k}, u_{m_k+1}) + b^2S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k}).
\]

Letting \( k \to \infty \), we have

\[
\frac{\epsilon}{b^2} \leq \lim_{n \to \infty} S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k}).
\]

But

\[
\lim_{n \to \infty} S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k}) \leq \lim_{n \to \infty} 9b^4S_b(H_b(u_{m_k+1}, \kappa_{m_k+1}), H_b(u_{m_k+1}, \kappa_{m_k+1}), H_b(u_{m_k}, \kappa_{n_k}))
\]

\[
\leq \lim_{n \to \infty} [S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k}) - \beta(S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k}))].
\]

It follows

\[
\lim_{n \to \infty} S_b(u_{m_k+1}, u_{m_k+1}, u_{n_k})) \leq 0.
\]

So that

\[
\epsilon \leq 0,
\]

it is a contradiction.

Hence \( \{ u_n \} \) is a \( S_b \)-Cauchy sequence in \( (X, S_b) \). By completeness \( \exists \eta \in U \ni \)

\[
\lim_{n \to \infty} u_n = \eta = \lim_{n \to \infty} u_{n+1}. \quad \text{(16)}
\]

Since

\[
\frac{1}{4b^3} \min \{ S_b(\eta, \eta, H_b(\eta, \kappa)), S_b(u_n, u_n, H_b(u_n, \kappa)) \} \leq S_b(\eta, \eta, u_n).
\]

\[
\frac{1}{2b}S_b(H_b(\eta, \kappa), H_b(\eta, \kappa), \eta) \leq \lim_{n \to \infty} \inf S_b(H_b(\eta, \kappa), H_b(\eta, \kappa), H_b(u_n, \kappa))
\]

\[
\leq \lim_{n \to \infty} \inf 4b^5S_b(H_b(\eta, \kappa), H_b(\eta, \kappa), H_b(u_n, \kappa))
\]

\[
\leq \lim_{n \to \infty} \inf [S_b(\eta, \eta, u_n) - \beta(S_b(\eta, \eta, u_n))]
\]

\[
= 0.
\]
It follows that $\eta = H_b(\eta, \kappa)$. Thus $\kappa \in B$. Clearly $B$ is closed in $[0, 1]$. Let $\kappa_0 \in B$, then $\exists u_0 \in U \ni u_0 = H_b(u_0, \kappa_0)$. Since $U$ is open, then there exists $r > 0$ such that $B_{S_b}(u_0, r) \subseteq U$. Choose $\kappa \in (\kappa_0 - \epsilon, \kappa_0 + \epsilon)$ such that $|\kappa - \kappa_0| \leq \frac{1}{M^3} < \epsilon$. Then for $u \in B_p(u_0, r) = \{u \in X/S_b(u, u, u_0) \leq r + b^2S_b(u_0, u_0, u_0)\}$. Also

$$\frac{1}{4b^3} \min\{S_b(u, u, H_b(u, \kappa), S_b(u, 0, H_b(u_0, \kappa)))\} \leq S_b(u, u, u_0).$$

$$S_b(H_b(u, \kappa), H_b(u, \kappa), x_0) = S_b(H_b(u, \kappa), H_b(u, \kappa), H_b(u_0, \kappa_0))$$

$$\leq 2bS_b(H_b(u, \kappa), H_b(u, \kappa), H_b(u_0, \kappa_0))$$

$$+ b^2S_b(H_b(u, \kappa_0), H_b(u, \kappa_0), H_b(u_0, \kappa_0))$$

$$\leq 2b|\kappa - \kappa_0|$$

$$+ b^2S_b(H_b(u, \kappa_0), H_b(u, \kappa_0), H_b(u_0, \kappa_0))$$

$$\leq 2b^2 \frac{1}{M^3} + b^2S_b(H_b(u, \kappa_0), H_b(u, \kappa_0), H_b(u_0, \kappa_0))$$

Letting $n \to \infty$, we obtain

$$S_b(H_b(u, \kappa), H_b(u, \kappa), x_0) \leq b^2S_b(H_b(u, \kappa_0), H_b(u, \kappa_0), H_b(u_0, \kappa_0))$$

$$\leq 4b^5S_b(H_b(u, \kappa_0), H_b(u, \kappa_0), H_b(u_0, \kappa_0))$$

$$\leq S_b(u, u, u_0) - \beta(S_b(u, u, x_0))$$

$$\leq S_b(u, u, u_0).$$

Thus for each fixed $\kappa \in (\kappa_0 - \epsilon, \kappa_0 + \epsilon)$, $H_b(., \kappa) : B_p(u_0, r) \to B_p(u_0, r)$. Then all conditions of Theorem (7) are satisfied. Thus we conclude that $H_b(., \kappa)$ has a fixed point in $U$. But this must be in $U$. Therefore, $\kappa \in B$ for $\kappa \in (\kappa_0 - \epsilon, \kappa_0 + \epsilon)$. Hence $(\kappa_0 - \epsilon, \kappa_0 + \epsilon) \subseteq B$. Clearly $B$ is open in $[0, 1]$. To prove the reverse, we can use the similar process.

6. Conclusions

In this paper we conclude some applications to integral equations and homotopy theory by using $(\alpha, \beta)$-rational contraction fixed point theorems in partially ordered $S_b$-metric spaces

7. Declaration

— Competing Interesting: The authors declare that they have no competing interest.

— Funding: No funding.
Author contributions: All authors contributed equally and significantly in writing this article. All authors read and approved the final manuscript.

Acknowledgment: The authors are very thanks to the reviewers and editors for valuable comments, remarks and suggestions for improving the content of the paper.
